

Backend Codebase Overview

This healthcare platform connects patients, providers, care managers, and physicians through mobile applications, administrative tools, and third-party healthcare integrations.

1. Patient Lifecycle

Patients are imported from Athena EHR based on eligibility criteria. After onboarding, they can register through the mobile app, receive welcome communications, and are synchronized with Lightbeam for monitoring. Only patients have access to the mobile application.

2. Provider Management

Providers are invited and approved by administrators, communicate through Sendbird, manage appointments via Acuity Scheduler, and use HNC Video for consultations.

3. Physician Integration

Physician data is synchronized from Athena EHR, and generated PDF reports can be sent directly to patient charts and physician records.

4. Care Management & Monitoring

Care managers use Lightbeam to monitor patient health indicators, receive automated alerts, and communicate with patients through messaging services.

5. Risk Assessment System

Patient survey responses are analyzed to generate risk assessments, which are stored, converted into PDFs, and made available through administrative tools.

6. Core Technical Integrations

Athena EHR, SendGrid, Twilio, Sendbird, Acuity Scheduler, HNC Video, Lightbeam, AWS S3, Sidekiq, Redis, Devise, Stax, Prawn, and Administrate form the platform's integration ecosystem.

7. Architecture & Development Principles

The application follows Ruby on Rails MVC architecture enhanced by SOLID principles, Interactors for business logic, and RuboCop for code quality enforcement.

One-Line Summary

A healthcare platform integrating EHR systems, patient engagement, provider collaboration, risk analysis, scheduling, and care management using a scalable Rails architecture.
